

XLingPaper's use of T_EX Technologies

H. Andrew Black, Hugh J. Paterson III

Abstract

We discuss the use of T_EX technologies by XLingPaper, an authoring tool for producing academically oriented publications with features required for linguistic publishing. We present the T_EX modules used and the rationale for the history of XLingPaper development.

1 Introduction

Within the publishing industry, there are several notable products for producing complex documents in beautiful formats. T_EX [25] [26] is one of the well-known publishing technologies used to meet these needs. Since 2000, XML-based technologies such as XSL-FO¹ or the T_EXML² project [30] have been used to integrate content and compose complex documents such as textbooks and maintenance manuals. Requirements for composing these large, inter-linked documents birthed the development of tools like XMLmind,³ the <oXygen/> XML Editor,⁴ and Xpublisher.⁵ These tools can be used to compose content within predefined XML structures. XLingPaper, as discussed in [7] [8] [9], seeks to provide a constrained environment in which authors of complex works dealing with language descriptions and linguistic analyses can focus on content structure independently from the styling requirements of documents. In this way the underlying design principle of XLingPaper maximizes the SGML design practice of separating content from presentation. With XLingPaper, authors can keep content structure independent from page layout information and thereby provide maximal transferability between publishing styles. The software does this while providing authors a clear structured interface for authoring content.

XLingPaper is designed to reduce friction in the process of writing, composing, and publishing linguistic papers, grammars, and books by removing common time-sinks related to inconsistent formatting (especially citations, references, and numbered elements like examples). A full list of benefits to all parties in the publishing work flow is available [9].

The XLingPaper software has a growing number of users who have successfully typeset complex documents that, among others, include:

Figure 1: XLingPaper predefined document types via DTD

- master theses [54] [27] [35],
- doctoral dissertations [17] [40],
- textbooks [32],
- linguistic grammars [11],
- books [1] [41],
- journal articles [10] [36], and
- bilingual software documentation [2] [3].

2 What is XLingPaper?

XLingPaper⁶ is a plug-in to the XMLmind XML Editor. XLingPaper benefits from the XMLmind XML Editor's Java-based implementation which allows it to be used on Mac OS X, Windows, and Linux. Via a DTD, XLingPaper defines several document classes (articles, books, chapters, etc., as illustrated in Figure 1), in each case providing document layout sections (paragraphs, examples, endnotes, etc.). Figure 2 illustrates the main screen of the user-interface of XMLmind XML Editor. By using this interface, formatting errors are reduced because users are constrained on where in the document flow they can introduce block and line level document elements. That is, first, authors cannot input page layout instructions directly into the document and second, the introduction of layout sections within the document flow is constrained via the DTD.

⁶ software.sil.org/xlingpaper

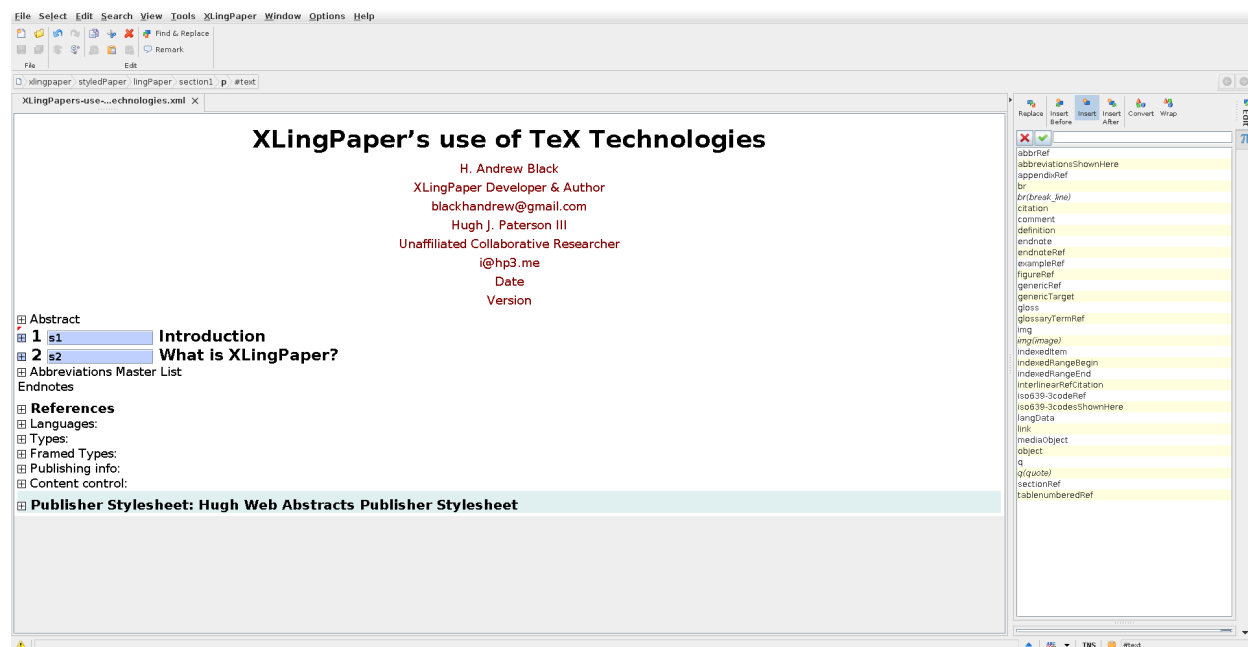

Figure 2: XLPingPaper’s user interface. Left side: document content editing. Right side: block and line level units available for use at the cursor location.

For many, the PDF format is the quintessential file format for final distribution of publishing outputs. XLPingPaper supports PDF production; however, as illustrated in Figure 3, XLPingPaper can also produce documents with at least five outputs, all from the same source document:

- PDF (version 1.5),
- Web pages (HTML 4),
- Microsoft Word (.doc),
- Open Office Writer Document (.odt), and
- ePUB.

XLPingPaper automatically numbers tables, examples, figures, and sections. It keeps track of internal references to these entities along with citation references, abbreviations, and gloss abbreviations. This keeps numbering and reference links dependable and automated. XLPingPaper also automatically generates indexes, a table or list of abbreviations used, and a section for references cited (using a custom references implementation).

Unlike most editing programs which are based on either the WYSIWYG paradigm or are unconstrained text editors such as those used to code or produce Markdown, XLPingPaper (via the XMLmind XML Editor) is a structured editor much more like the block editors we see in tools like MailChimp⁷ or WordPress’s Gutenberg editor,⁸ albeit without

the drag-and-drop features. Rather than visually structuring the document to look the way it is to be formatted, the author “marks up” the items in the document according to their kind. One of the many benefits that using a DTD provides is that there is a “grammar” of what a well-formed linguistic document looks like. This makes moving, replacing, switching, or reordering sections, chapters, tables, figures, and examples less error prone because it prevents users from inadvertently creating ill-formed documents. The following sections of this paper discuss the TeX technologies used by XLPingPaper.

3 XLPingPaper and TeX

Linguistic publishing has unique requirements when compared to general publishing. The following sections provide more detail on the linguistic publishing context, design requirements and L^AT_EX packages used by XLPingPaper.

3.1 TeX and Linguistic document production

TeX has long been embraced by linguists. Peter [38] writes of a personal communication with Don Knuth where Knuth suggests that linguists were some of the earliest adopters outside of mathematicians. Thiele [49] in an interview given in 2007 states that she was typesetting linguistic journals via TeX in 1983—a date prior to the release of Knuth’s book on using the TeX typesetting system [25]. Thiele [48]

⁷ mailchimp.com

⁸ developer.wordpress.org/block-editor

Figure 3: XLPingPaper’s data processing pipeline to multiple formats

gives an early overview of \TeX use in linguistics with mention of significant repositories outside of CTAN. A slightly more recent (2004) update by Peter [38] provides some additional tips and tools for typesetting common information structures in linguistic publishing. The \TeX community has produced many packages which have shaped the visual face of publishing in linguistics, including `tipa`⁹ by Rei [42], which provided access to an excellent typeface for phonetic transcriptions, and `pst-asr`¹⁰ by Frampton [18] for autosegmental representations. Some packages used in linguistic publishing are special purpose but are not exclusive to linguistics. For example, Donnelly [16] describes how to use various packages to draw phonetic pitch traces using \TeX . Peter [38] and Thiele [48] list out and review (through 2004) various packages across several areas of linguistics. Among others, they discuss several packages used to draw syntax trees such as `qtrees`¹¹ and `forest`¹² and specialized packages for presenting examples and interlinear glossed texts such as `expex`.¹³ Their reviews also discuss packages such as

`covington`¹⁴ and `gb4e`¹⁵ whose collections of macros serve a variety of page layout functions targeted at publishing in linguistic topics.

The CTAN repository currently lists fifty-four different \TeX packages for linguistic typesetting,¹⁶ though some of these packages also include capabilities targeted as multi-lingual or multi-script publications or are specific style sheet implementations for publications at linguistic programs at institutions of higher education (there may be more packages which are not tagged but should be). Several of the packages tagged “linguistic” pre-date Unicode [50] but still see significant use. Sometimes it is the case that secondary packages are developed in an attempt to “fix” publishing outputs in different ways to bring Unicode features along with the features of the original package. For example, `tipa` is not Unicode compatible, but the packages `unitipa`¹⁷ and `tipauni`¹⁸ seek to address different implications of not publishing with Unicode while giving access to the beautiful typeface of `tipa`. Understanding the long history of publishing and the interdependency

that packages have (including the order of loading packages) constitutes barriers of adoption to new \TeX users.

We discuss \TeX barriers of adoption for two reasons. First, it exemplifies some of the complexities that XLPaper seeks to simplify as it presents authors not just a visual environment for document composition, but also a cohesive output solution. Second, it speaks to the software design process in finding the minimal viable product. That is, *how much (or little) of a software stack is needed to make a usable software product for linguistic publishing?* The \TeX community is divided on this. While the diagrams in linguistic books and journals since the 1980's exemplify many beautiful, sharp, crisp, illustrations created directly in \TeX , many trainers of \TeX tools,¹⁹ but not all,²⁰ have steered authors towards a more generic set of packages which do not include specific diagram creating macros. Rather, they suggest that authors use secondary illustration tools to generate illustrations and then include them as vector PDFs or images. In fact this second method is the document production path that the XLPaper philosophy follows. That is, XLPaper reduces the complexity of the typesetting task for authors by requiring complex visualizations to be produced via graphical tools. We have found tools like Figma²¹ and Inkscape²² very helpful in the graphic production task. The XLPaper product seeks to lower barriers of entry, only produce valid documents, and keep the code base to a minimum.

As mentioned in the discussion of `tipa`, linguistic documents have not always been typeset with Unicode. Unicode was introduced in 1991 and by the early 2000's Unicode along with document and data storage in XML formats were being heralded in academic linguistics as a best practice in order to avoid vendor lock-in, increase interoperability across use cases, and to separate data life-cycles from encoding or software life-cycles [5] [6] [51]. Due to the heavy reliance on Unicode by today's practitioners of language documentation and linguistic work, XLPaper specifically uses \LaTeX and compatible packages to produce PDF outputs. This brings continuity to the text input process for users across their workflows. It also makes importing and using language or phonetically transcribed examples sim-

pler by removing the need to use macros to derive characters.

3.2 Design desiderata for XLPaper outputs via \TeX

Three goals have driven the development of XLPaper:

- separation of content and style,
- software accessibility (license and size), and
- beautiful multi-format outputs.

Deciding how \TeX technologies fit within the project has been a journey. XLPaper development started in 2001 without any use of \TeX technologies. In 2006, XLPaper added XSL-FO for PDF production. Prior to 2009, XLPaper used RenderX's XEP²³ product to produce PDF documents. As far as we know, there are two cross-platform XSL-FO processors written in Java: RenderX's XEP application and the Apache FOP project.²⁴ Using a Java implementation reduces the size of the required stack because the XMLmind XML Editor requires Java. XSL-FO processors can have various degrees of implementation of the XSL-FO standard. RenderX has some limitations which affect page layout but has more complete coverage than the Apache FOP project which lacks certain required table-oriented capabilities.²⁵ The limitations of RenderX are discussed in Section 5. In 2009 plans were made to add \LaTeX -based output to XLPaper because, while there was a free version of RenderX, the output contained a watermark. By implementing the ability to export to PDF via \LaTeX , watermarks could be avoided all together. The \LaTeX method of PDF production is now the default method to produce PDF documents, although the RenderX method is still possible.

Maintaining a separation of content and style in the XLPaper environment was a key design requirement. When the \LaTeX method of PDF production was introduced, XLPaper already had a way to format output per a user-created publisher style sheet — allowing great flexibility due to the separation of style and content. Using \TeX technologies meant the developer (Andrew Black) needed to be able to map from an XLPaper publisher style sheet to \LaTeX . It was known that \LaTeX was the ideal \TeX implementation to target. However, pure \LaTeX came with predefined output formatting for front matter, chapters, sections, back matter, etc. Pure \LaTeX , then, would not allow direct control of

¹⁹ Among others, see the Linguistics Dissertation guide for the University of Hawai'i at Mānoa [21], University of Pennsylvania [15], and Language Science Press Guidelines [34].

²¹ figma.com

²² inkscape.org

²³ renderx.com/tools/xep.html

²⁴ xmlgraphics.apache.org/fop/index.html

²⁵ xmlgraphics.apache.org/fop/compliance.html

formatting of all of these per an XLingPaper user-defined publisher style sheet. This required overriding these standard features of L^AT_EX with a custom implementation of the T_EX commands needed to control formatting. XLingPaper takes a custom approach in implementing flexibility here. Table 1 lists the custom commands implemented.

The programmer of XLingPaper recently discovered `memoir`²⁶ [52] [53]. As a package, `memoir` accomplishes many of the same tasks and could be considered to replace some of the custom code if it were shown to be easy to implement and that the size of the total XLingPaper code base would be reduced.

The distributability of the software was also seen as a design requirement. Distributability is understood to have two components: license and accessibility, including size.

From the outset, XLingPaper was designed to be costless to the end user. It is licensed under the MIT license, and its code is currently available on Github.²⁷ The XMLmind XML Editor had a costless Personal Use License that met this requirement for the vast majority of the target audience of XLingPaper. The few XLingPaper users who did not meet the terms of that license most likely would be able to afford to purchase (or have their organization purchase) a professional license of the XMLmind XML Editor. The actual XLingPaper plug-in has always been free.

The software size of XLingPaper is a major design influencer. Many of the expected users of XLingPaper live and work in places around the world where Internet connections are characterized by high costs, low bandwidth capacity, and general unavailability. Therefore, the download required to install XLingPaper needed to be as small as possible. On Windows the current full XLingPaper installer is 146MB, and the XMLmind XML Editor installer is 116MB. Both are required. This stands in contrast to the T_EXLive 2010 installer which has a size of about 1.2GB when downloaded and 2.38GB when uncompressed. The size constraint impacts XLingPaper because its distribution must be independent of larger mainstream T_EX distribution solutions which have a large footprint. This, of course, includes T_EXLive. Therefore the developer identified which L^AT_EX packages and binaries were needed and created a custom installation package which met the required specifications.

XLingPaper currently uses the following L^AT_EX packages (in alphabetical order):

| | |
|--------------------------|--------------------------|
| <code>attachfile2</code> | <code>lineno</code> |
| <code>booktabs</code> | <code>longtable</code> |
| <code>calc</code> | <code>lscape</code> |
| <code>color</code> | <code>mdframed</code> |
| <code>colortbl</code> | <code>multirow</code> |
| <code>etoolbox</code> | <code>normalem</code> |
| <code>fancyhdr</code> | <code>polyglossia</code> |
| <code>fontspec</code> | <code>setspace</code> |
| <code>footmisc</code> | <code>tabularx</code> |
| <code>hyperref</code> | <code>xltxtra</code> |

The twenty L^AT_EX packages that are part of the custom XLingPaper distribution are still rather large (29MB) for someone for whom Internet bandwidth is an expensive and inconsistent commodity.

To reduce bandwidth requirements two assumptions were made which have more or less proven to obtain. The first assumption that the developer made was that the twenty packages and binaries would not need to change over time; in contrast, the second assumption was that XLingPaper would acquire new features and need bug fixes. These assumptions resulted in an architecture where page layout information expressed in XML is translated via custom T_EX commands to either T_EX directly or to commands understood by L^AT_EX packages distributed with XLingPaper. This abstraction layer was then executed when the X_LL^AT_EX file was processed. This middle layer has granted XLingPaper flexibility in adding new code and capabilities while keeping the “heavy” L^AT_EX packages stable. The net result is a “heavy” first install package (116MB), but light-weight upgrade packages (6.21MB). In the thirteen year history of development, there have been a few occasions where upgrades have required the download of new “heavy” packages. One such case was when the ability to use framed units was added. These elements depend on the `mdframed`²⁸ package [13]. The architecture separating stable packages from custom code, however, has generally worked out well and kept update sizes low.

3.3 PDF production

We know of two pathways for converting XML content into PDFs. The first is via XSL-FO, and the second is via T_EXML which converts XML content to T_EX formatted documents for further processing to PDF. Given certain limitations in both XSL-FO and T_EXML, XLingPaper uses a custom (or third) method. When an author instructs XLingPaper to

²⁶ ctan.org/pkg/memoir

²⁷ github.com/sillsdev/XLingPap

²⁸ ctan.org/pkg/mdframed

Table 1: Custom commands used by XLingPaper

| Command for | Purpose |
|-------------------|---|
| Table of contents | Store and retrieve page numbers; format the contents. |
| Lists | Numbered and bulleted lists with control over indents, etc. |
| Examples | Example number and example content, where the content can be a line, a list of lines, a set of words, a list of a set of words, interlinear, a list of interlinears, etc. |
| Indexes | Handle keeping track of XLingPaper’s indexing capability, including page numbers. |
| Interlinears | Handle lines in an interlinear text or example, including dealing with an ISO 639-3 code in an interlinear example. |
| Block quotes | Handle special cases needed for block quotes. |
| Table headers | Attempt to calculate a column’s width via its contents. |

produce PDF output via $X_{\text{L}}^{\text{L}}\text{TeX}$, XLingPaper produces a $\text{T}_{\text{E}}\text{XML}$ -like XML file. This is then converted into a $\text{L}^{\text{A}}\text{T}_{\text{E}}\text{X}$ formatted document via a set of XSLT transforms and processed via $X_{\text{L}}^{\text{L}}\text{TeX}$ to produce the PDF. Figure 3 contains a diagram of the data handling process.

3.4 $\text{T}_{\text{E}}\text{XML}$

$\text{T}_{\text{E}}\text{XML}$ was discovered in the process of planning for the transition of the default PDF renderer from RenderX’s XEP to $X_{\text{L}}^{\text{L}}\text{TeX}$. Initial analysis conducted in 2009 understood $\text{T}_{\text{E}}\text{XML}$ to have two infelicities for use-cases required in linguistic publishing with XLingPaper:

1. $\text{T}_{\text{E}}\text{XML}$ has Python as a dependency and the XLingPaper developer did not want to require their users to install a version of Python specifically for $\text{T}_{\text{E}}\text{XML}$. Of particular concern were potential conflicts with other installed versions of Python on user’s operating systems. Moreover, the $\text{T}_{\text{E}}\text{XML}$ approach would make the installation package for XLingPaper much larger due to the inclusion of Python.
2. XLingPaper users require a high degree of control for white space. The fine grain control of whitespace was not immediately clear how to accomplish with $\text{T}_{\text{E}}\text{XML}$.

3.5 Control characters

Even with the use of Unicode in the text of documents, there are some features of typesetting with $\text{T}_{\text{E}}\text{X}$ -based implementations which require the use of control characters. Additionally, XML also has control characters. In $\text{T}_{\text{E}}\text{X}$ these include [,], <, and >. When transforming data between XML and $\text{T}_{\text{E}}\text{X}$, $\text{T}_{\text{E}}\text{X}$ control characters and commands need to be escaped to ensure proper data processing. This has been implemented via Java since Java was already present in the dependency stack due to the XMLmind XML Editor requiring it. Additionally,

Figure 4: XLingPaper combines style and content information contained in its custom XML and then exports it into three different formats for further processing.

some small methods have been written in Java to provide additional access to features via the graphical user interface. Among other things, these include adding rows and/or columns to tables, automatically converting glosses to abbreviation references, and importing references from various XML formats.

3.6 Ling- $\text{T}_{\text{E}}\text{X}$

One might ask, “Why not add more linguistic related $\text{T}_{\text{E}}\text{X}$ packages to the available stack, or use those instead of creating custom code?” The answer has two simple parts: First, in 2009 the linguistic capabilities of $\text{T}_{\text{E}}\text{X}$ packages were different than they are today. Second, XLingPaper is more than a $\text{T}_{\text{E}}\text{X}$ document producer. For example, some authors [2] [3] use XLingPaper to manage multilingual content on websites.

Besides $\text{T}_{\text{E}}\text{X}$, XLingPaper also produces XSL-FO and XHTML/CSS outputs. When new features are considered for inclusion, they must be considered for all output formats.

After excluding T_EXML as a viable option, and still seeking to create X_LA_TE_X-based output, a solution was needed to determine which set of minimal T_EX packages would be needed. The Ling-T_EX group,²⁹ which also ran the Ling-T_EX mailing list from 1995–2018, was discovered.³⁰ Ling-T_EX seemed to be the locus of activity in linguistic typesetting via T_EX even though other web pages discussing linguistics and T_EX also existed, e.g., Essex³¹ and UPenn.³² Today, now that the mailing list is no longer in operation, many of the mailing list participants can be found interacting on the T_EX stackexchange.³³

State-of-the-Art for T_EX-based linguistic publishing in 2009, as recommended by the Ling-T_EX website, suggested using `covington` and `ling-mac`—the list of macros discussed by Thiel in [48]. These macros were used to solve similar use cases, among others, to those already implemented by X_LingPaper. Their approaches and outputs, however, had more limitations than what X_LingPaper already offered. X_LingPaper had the following capabilities for typesetting interlinears:

- no limits on the number of lines within an interlinear grouping;
- no limits on the number of free translation and literal translation lines;
- the ability to include a source reference within the interlinear; and especially
- the ability to tag interlinear items with an ISO 639-3 code for the language used in the interlinear.

At the time the best solution given the state of the T_EX packages available was custom T_EX scripts, although now similar features may be possible via other packages. For example in 2019 Pellard [37] discussed the limiting approaches in various T_EX packages related to interlinear glosses and his solution `typgloss`.³⁴ X_LingPaper’s examples can be seen in Figures 6–7 which contain output illustrating some of the special capabilities X_LingPaper offers.

4 Typesetting tasks X_LingPaper users often encounter

Linguistic documents have several formatting needs that other kinds of documents do not. This section discusses some of them.

Figure 5: List of words as seen in [40]

4.1 Numbered example layouts

Linguistic documents usually have many numbered examples. The prose often refers to examples which are typographically nearby or to previous examples. X_LingPaper automatically keeps track of the example identifiers. This is especially important in linguistic publishing because authors, and publishing style sheets, often make use of different kinds of examples, including sub-examples, and table-like design layouts which can contain lists of words along with their glosses (as shown in Figure 5) and interlinear clauses (as shown in Figure 6). Some cases even have headings in portions of the example.

4.2 Interlinear glossed texts

There is a long tradition within linguistics and language study of presenting phrases containing different languages (but the same content) as interlinear texts. Di-Biase-Dyson et al. [14] trace the practice back as far as the 1652 publication of Kircher [24]. More recent publications display significant variation in page layout related to interlinear glossed texts and interlinear examples. Variation exists in three dimensions:

- content elements,
- data-structure of the encoded elements, and
- page layout (visual display of the elements).

A full demonstration of the variation in content and its positioning across common style sheets in linguistics is beyond the scope of this paper. Significant variations include the presence or absence of the following elements:

- index elements such as example numbers or sub-numbers (as shown in Figure 6),
- headings to the interlinear,
- speaker indicator,
- language indicator,
- citation indicator pointing to the larger text from which the example element is taken (see Figure 6 for an example), and

Una frase cuantificadora puede acompañar al sustantivo (véanse [Los Cuantificadores](#) y [Los Números Cardinales](#)). Cuando se presenta esta frase, siempre va delante del núcleo de la frase nominal, como en los ejemplos en (2).

'Tiene cinco esquinas picudas' [FC:5.1]

El cuantificador puede presentarse en construcciones donde no hay sustantivo expreso, como se explica en [Los Cuantificadores](#). Un ejemplo se incluye aquí.

Figure 6: Interlinear example from [31]. Note the example numbers on the left followed by example groups (a) and (b). Each interlinear then also has a language indicator in square brackets. Customization allows for as many rows per group as is required. Finally, on the right the hyperlinked citation to the reference for the source text is indicated.

- limits on the number of rows in the original, gloss, translation, and free translation tiers.

Existing T_EX packages approach these content requirements in different ways. As far as we can tell, the following commonly used packages for interlinear glossing all have limitations to some degree. The `expex` package does not offer a content solution for the language code or the citation. The package `langsci-gb4e`,³⁵ a fork of `gb4e`, supports the *Leipzig Glossing Rules*,³⁶ a commonly adopted set of linguistic typesetting conventions. While the Leipzig Glossing Rules do call for the language name or identifier to appear on the right hand side of the interlinear glossed text, however, it does not have a place for the citation. The package `linguex` does not have either language or citation content places built in. With these considerations, it was clear in 2009 that X_LingPaper offered more to authors than any single package in the T_EX ecosystem. In order to implement existing X_LingPaper features, it meant creating custom T_EX scripts to implement interlinear texts.

There are also some reasons related to data structure for considering X_LingPaper over alternatives. Interlinear glossed texts are often stored in one of a few formats: ELAN files,³⁷ FLE_x Text files,³⁸

Standard Format files,³⁹ L^AT_EX files,⁴⁰ custom project-specific XML files, or relational databases such as MySQL, PostgreSQL, or FileMakerPro. Moving content from analysis and markup tools to typesetting tools is an ever present need for linguists. Several tools such as ELAN and FLE_x have well-established workflows for data transfer [43]. FLE_x is often considered the tool of choice for many field linguists, language documenters, and lexicographers. For many linguists entering the field, it is the tool of choice over older tools like Toolbox (which uses standard format files) due to built-in collaborative features and grammar parsers [4]. Interlinear text in FLE_x can be exported into XML and the data used within X_LingPaper documents. This presents FLE_x users the opportunity to typeset their texts rather easily. Enabled by XML's modular document referencing features, X_LingPaper documents can reference components. Using the XML document referencing strategy with XML-encoded FLE_x texts allows authors to reflow typesetting outputs easily if they make content changes in their FLE_x environment.

X_LingPaper does not have a direct ELAN import process. However, we have had reports of linguists using the FLE_x-X_LingPaper publication pathway to typeset ELAN texts in L^AT_EX documents. One user reports capturing the X_LingPaper document prior to rendering and then copying the relevant T_EX sections to their primary document and adding any

³⁸ software.sil.org/fieldworks

³⁹ software.sil.org/toolbox

⁴⁰ For examples see [44] and [47].

required packages required by XLingPaper to the header of their primary \TeX document.

Still finally, there is the matter of page layout. The main types of variation in page layout we have seen include the grouping of lines into sets or subsets (see Figure 6 for example), the labeling of sets and subsets, wrapping of interlinear glosses across lines (recall that these may themselves include three or more lines), and the alignment of the various elements of content within the interlinear glosses. We have seen word and morpheme aligned interlinears. XLingPaper automatically wraps interlinears which makes the author’s job much easier. Figure 7 in FC:1 and FC:2 demonstrate the wrapping of interlinear glossed texts. It does so by formatting each aligned word in an `hbox` and then having \XeTeX put them together in a hanging indent paragraph. This is based on the work of Kew & McConnel 1990 [23].

4.3 Gloss abbreviations

Linguists use two types of abbreviations. First, they might use abbreviations for names, titles, or commonly used words. This is much like standard publishing. The second way that linguists use abbreviations is for indicating the grammatical meaning of pieces of words (morphemes). This second usage is often referred to as ‘glossing’ with the abbreviations referred to as ‘glosses.’ One common set of glosses is the *Leipzig Glosses*. Leipzig Glosses, however, are not universally used for several reasons including:

- some authors have established their own tradition within their works which they started prior to the release of the Leipzig Glosses,⁴¹
- the typeset examples are quoted from a database which does not use Leipzig Glosses,
- they are not comprehensive, and
- they are not theoretically sufficient for some linguists.

XLingPaper supports both types. XLingPaper approaches this by providing built-in access to Leipzig Glosses, but also allowing the author to fine-tune a set of abbreviations and their definitions. When producing the output, XLingPaper creates hyperlinks between the abbreviation and its definition. This allows readers to quickly find the meaning of glosses and for the automatic generation of a table or list of abbreviations used.

⁴¹ For examples of the variation and scope of coverage consider the works of Greville Corbett, William Croft, Denis Creissels, and Martin Haspelmath.

4.4 Bibliographies

For better or worse XLingPaper has rolled its own bibliography solution. Import options are provided for MODS and EndNote XML formats. This enables users to import from tools like EndNote,⁴² Zotero,⁴³ and JabRef.⁴⁴ XLingPaper uses custom \TeX scripts to output \TeX code for final rendering. It does not rely on \BibTeX or \BibLaTeX . Figure 8 shows an example of a bibliography created with XLingPaper.

5 Outputs \LaTeX allow that others do not

While XLingPaper has a large array of linguistically-oriented formatting capabilities across all output formats, there are some that only the \XeTeX output can produce. This is, of course, due to the formatting power of \TeX and \XeTeX .

5.1 Automatically wrapping interlinears

One of the most popular features of XLingPaper is its ability to automatically wrap long interlinear examples and lines in interlinear texts. As seen in Figure 7, wrapping occurs for the glossed text tiers. Not shown, but equally important, is that free translation tiers which are often longer than glossed lines also wrap neatly and coherently.

For the XHTML and RenderX outputs, the interlinear examples do not wrap; they run off to the right, which means completely off the page for RenderX. To fix this, the XLingPaper user must break the interlinear into smaller units by hand.

5.2 Font rendering

\XeTeX renders fonts extremely well. We show three cases where XSL-FO (via RenderX) and/or XHTML outputs have text rendering issues while \XeTeX does not.

First, when a line of text contains material rendered in different fonts on the same line, the two fonts may not line up evenly in the vertical direction. See Figure 9. This mismatch is due to the two fonts having different ascender and descender values. In order to overcome this when using XSL-FO, one has to add custom commands to deal with the font that differs from the primary font.

Second, the RenderX way of producing PDF cannot handle stacked diacritics, but the \XeTeX way does it very well. See Figure 10.

Third, \XeTeX can even handle special features requiring Graphite⁴⁵ processing. Graphite is a multi-part technology which includes a rendering

engine and a rule-based grammar which compiles against a TrueType font and effectively extends the font allowing for additional glyph selection and context shaping. [22] [12] [45] Figure 11 illustrates the special font handling needed for the Awami Nastaliq font. Of the four output renderings, the only one that renders correctly is the X_qL^AT_EX one that uses Graphite.⁴⁶

5.3 Hyphenation for non-English languages

Since we use the `polyglossia` package, one can write an XLingPaper document in any of the sixty-

⁴⁶ One must use XLingPaper's X_qL^AT_EX package from T_EXLive 2020 (software.sil.org/xlingpaper/xelatex-package-from-tex-live-2020/) for this particular font. The Graphite included in the 2010 version of X_qL^AT_EX is not capable of rendering Awami Nastaliq well.

one non-English languages listed in the `polyglossia` documentation and indicate the language code for this language in a document-wide attribute. XLingPaper passes this information to X_qL^AT_EX which will hyphenate according to that language's hyphenation rules.

5.4 Author contact information

XLingPaper allows one to define sets of contact information for authors containing things like name, address, affiliation, email address, phone number, etc. With the X_qL^AT_EX output, these author contact information boxes will wrap if there are more of them than will fit on one line on the page. The lines containing these boxes will also be justified. Neither the XHTML nor the RenderX outputs automatically wrap these boxes. They also do not justify them.

5.5 Vertical fill

For title page material, only the X_qL^AT_EX output allows using vertical fill between items on a particular page of output. This can be useful for automatically inserting whatever vertical space is needed between, say, the last author's name and some publishing information that needs to appear at the bottom of the page. RenderX requires using overt, fixed vertical spacing values. For the X_qL^AT_EX output, then, one does not need to manually adjust this vertical space for each document. One must do so for the RenderX output, however. This is a non-issue for the XHTML

X_QL_AT_EX:
(using Graphite)

Figure 11: Awami Nastaliq rendering. Only the X_YL^AT_EX output using Graphite is correct.

output because there are no page breaks like there are in PDF output.

5.6 Line numbering

When submitting an article for review, some publishers want the PDF to have continuous line numbers throughout the document. Only the X_qL^AT_EX output does this.

6 Features other outputs have that the L^AT_EX output does not

X_qL^AT_EX does not allow for custom table cell padding and spacing. Having said that, the developer cannot remember any XLingPaper user ever asking for a way to do this for the X_qL^AT_EX output. It just looks great.

Background color is not available for section titles.

Section 11.17.1.1 “Known limitations of using X_qL^AT_EX” in the XLingPaper user documentation lists known problems.

7 Conclusion

While the XLingPaper approach to composing documents via DTD-controlled user interface limitations has great value in and of itself, the fact that it can produce great looking output via X_qL^AT_EX makes the learning curve rewarding. We feel that being able to produce PDF via X_qL^AT_EX has made XLingPaper a fantastic tool for linguists.

Additionally, XLingPaper serves as a model for other developers who are seeking a modular approach to creating custom publishing solutions. That is, one does not need to deploy the whole T_EXLive system to create great looking outputs. Specific packages can be combined and redistributed to fit market needs.
